

Case Study

Elevation Convening Center & Hotel - Montgomery, AL

The Challenge

To provide a full Guestroom Management System (GRMS) without pulling any control wires and using only the power lines already installed in the ceiling and walls.

The Solution

Using the miniature CRSB dimmers installed behind switches and sconces, in pendant canopies and downlight enclosures, the purpose was achieved without interfering with the on-site conditions. Battery powered switches were added where switches j-boxes were not available, motorized black-out and sheers were controlled directly at the motor with no need of additional wiring and a gateway per room was added for smart door locks and HVAC integration.
