

Case Study

PJT Partners - New York, NY

The Challenge

PJT Partners' headquarters at 280 Park Avenue required a refined lighting control strategy across two floors of a high-performance financial workplace designed by JRM Construction Management. The space includes a 4,000 SF auditorium, executive reception, open workstations, private offices, and collaborative amenities. The lighting system needed to balance architectural elegance with operational flexibility, supporting tunable white and static lighting while integrating with complex AV and building systems. Consistency, precision, and ease of control were essential to maintaining a cohesive experience across the corporate fit-out.

The Solution

A BubblyNet lighting control system was deployed across approximately 1,000 devices, integrating 0–10V dimming, phase-controlled decorative fixtures, and tunable white lighting throughout the space. Coordinated scenes enable seamless transitions between auditorium events, collaboration areas, and executive environments while maintaining consistent visual comfort and design intent. The result is a unified lighting system that supports architectural clarity and advanced AV integration across both floors.
